McLean QUALITY DAFFODILS

"Washington Grown" Daffodils are now conceded to be the finest produced anywhere in the world. The excellency of these bulbs is due to a great many factors. Foremost among these is the most perfect climatic conditions for the growing and curing of hardy bulb stocks. The mild wet winter make for perfect growing conditions. The cool summers and proper atmospheric conditions are ideal for the proper curing of the bulbs.

Daffodils will thrive in any well drained garden soil. Prepare the soil deeply, 12 inches or more is best. Plant at least 6 inches deep, extra large bulbs are better planted 7 or 8 inches deep. (Some varieties make larger bulbs than others.) No manure should come

in contact with the bulbs. If the soil needs fertility, use bone meal at the rate of one-fifth pound to the square yard mixed with the soil below the bulbs.

A mulch of straw or leaves will be beneficial in very severe climates. If the mulch is applied after the first freeze, it will prevent thawing and heaving.

Daffodils, or Narcissus, are classified into several divisions. The number following the names of the different Daffodils represents the division. (1) Trumpet Narcissus—one flower to a stem; trumpet or cup as long or longer than the perianth segment (petals). (2) Large Cupped Narcissus—one flower to a stem; cup more than one-third but less than equal to the length of the perianth. (3) Small Cupped Narcissus—one flower to a stem; cup not more than one-third the length of the perianth. (4) Double Narcissus. (5) Triandrus Narcissus. (6) Cyclamineus Narcissus—trumpets straight and tube-like; perianths reflexed as in a cyclamen. (7) Jonquilla Narcissus. (8) Tazetta Narcissus—bear their fragrant flowers in clusters. (9) Poeticus Narcissus. Sub divisions are indicated by the letters (a)—perianth colored; cup colored not paler than the perianth. (b)—perianth white; cup colored. (c)—perianth white; cup white, not paler than the perianth.

Approximate blooming period is indicated by the letters **E** (early), **M** (mid-season) and **L** (late).

WHEN SHOULD I DIG DAFFODIL BULBS?

Daffodils are best dug and separated every two or three years in the garden; when used for naturalizing in grass or wooded places they may be left undisturbed for years. Bulbs should be dug when the foliage turns yellow and lays flat on the ground, it need not be completely dry. After digging they may be planted at once, or spread out to dry, in a cool ventilated place and planted any time until fall. Never dig in the fall; to do so may cause them to skip one year's bloom; should they bloom, flowers will be few and small.

QUALITY

TULIPS

Our Large Tulip bulbs are "TOP SIZE" or 12 centimeters (4 1/8 inches) in circumference. Our Second Size is 11 centimeters in circumference, or the commonly advertised "First Size".

Best results are to be had by using soil that Tulips have not been grown in for at least two years. Growing more than two years in the same soil eventually leads to failure. Do not use manure. If the soil needs fertility, mix bone meal with it at the rate of about three handfuls to the square yard. Plant 5 inches deep and at least 6 inches apart. In very severe climates a mulch of peat moss or leaves will be beneficial. This should be applied after the first freeze, and should not be over one inch deep.

INDOOR CULTURE—Follow directions for Daffodils, making sure that the flower bud can be felt in the green tips before bringing the pots into a temperature of about 60 degrees. If in doubt, wait a little longer.
